

## Eurol ML Injectie Coating

For airless or spray equipment, corrosion protecting, for internal coatings

### Description

Eurol ML Injection Coating is a thin, water-repellent, durable, anti-corrosion product. It has been especially formulated for hollow spaces like chassis beams, doors, door pillars, flanges, welded seams, decorative strips and chrome parts.

Eurol ML Injection Coating is made from mineral oils, paraffinic waxes and inhibitors. It has excellent anti-corrosion and water-repellent properties and will not affect rubber or lacquer. After evaporation from the solvent, a non-adhesive, brown waxy film will remain with an excellent resistance against climatic influences.

Eurol ML Injection Coating can be sprayed easily and shows a capillarity movement. By this, every spot will be covered. It can be applied by spray gun or airless spray equipment. Of course, it also can be applied by brush or by immersing.

### Physical properties

Colour	brown	
Flash point	39 °C	ASTM D 93
